## RescueNet® CodeWriter: Required Settings Changes

### Overview

The forthcoming release of CodeWriter (version 1.0.12) contains significant improvements to barcode scanning, security, settings administration, and more. This bulletin provides advanced notice of required settings changes to ensure uninterrupted functionality when upgrading CodeWriter. It also details optional changes you may wish implement.

### Required Updates

#### Scandit Smart Data Capture

- This feature makes barcode scanning faster, allows users to select the proper barcode when multiple are within the scanner window, improves the ability to scan partially damaged barcodes, and improves performance in poor lighting conditions.
- Before updating CodeWriter you must allow network access for all devices using CodeWriter to the Scandit license server. This will allow CodeWriter to validate the embedded license for the Scandit product. No user or patient data passes to the license server, it is used solely for license validation. If not implemented before upgrading CodeWriter, users will not be able to scan barcodes, however users will still be able to manually enter patient and device identifiers.
- To allow this communication, you must open outbound communications on port 443 to the following websites for all mobile devices utilizing CodeWriter:
  - sdk-api.scandit.com
  - scandk1.scandit.com
  - scandk2.scandit.com
  - scandk3.scandit.com
  - scandk4.scandit.com
  - scandk5.scandit.com
  - scandk1.mirasense.com
  - scandk2.mirasense.com
  - scandk3.mirasense.com
  - scandk4.mirasense.com
  - scandk5.mirasense.com

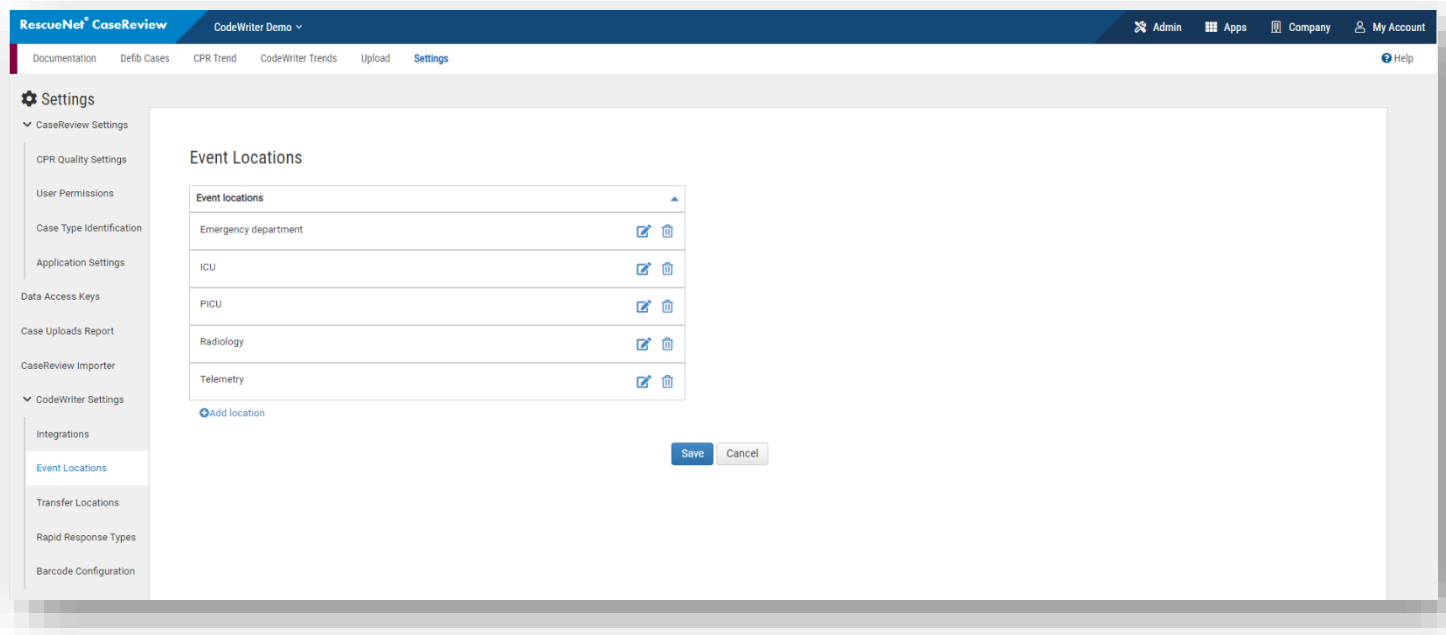

#### User Authentication for CodeWriter (ZOLL® Online Cloud Only Feature)

- ZOLL Online cloud customers will now need to login to access the 'end code' and 'existing code' screens within CodeWriter. This security enhancement improves data security, privacy, and associates a known user with the documentation.

- CodeWriter users must authenticate against your Active Directory or ZOLL Online to complete their documentation. This authentication must be enabled before upgrading CodeWriter.

### Event and Transfer Locations Settings\*

- Previously, location settings were administered within the CodeWriter application. To simplify administration and limit access, these settings are now available only to Administrators within CaseReview. Events locations must be added to your RescueNet® CaseReview tenant setting prior to upgrading CodeWriter to ensure they are available to documenters.
- Location settings must be added to the CaseReview settings page (only available to administrators). These settings are found under “event locations” and “transfer locations” in the page shown below:

### Optional Updates

**Rapid Response Type Selection\*** To enhance the clinical applicability of CodeWriter, functionality has been added to support rapid response documentation. To allow

documenters to pick a rapid response type, administrators can add custom “rapid response types” to the setting menu shown above.

**Barcode Configuration\*** To support myriad patient barcode formats, administrators can now configure CodeWriter to their facility specific format. This setting is accessed from the menu shown in the image above.

**EHR Integration (ZOLL Online Cloud Only Feature)** CodeWriter documentation, defib waveform full disclosure reports, and vital signs can now be sent to electronic health records through an ADT integrated solution. Please speak with your sales manager to learn more.

*\* These features are only available to ZOLL Online cloud customers until a compatible version of CaseReview On-Premise is released.*

## Contact

ZOLL support teams are available to assist with questions and ensure smooth implementation of these changes. Please contact our support teams should you need any assistance.
